1	<u>ABSTRACT</u>			
2	The instant invention involves the use of a			
3	combination of preparatory steps in conjunction with mass			
4	spectroscopy and time-of-flight detection procedures to			
5	maximize the diversity of biopolymers which are verifiable			
6	within a particular sample. The cohort of biopolymers			
7	verified within such a sample is then viewed with			
8	reference to their ability to evidence at least one			
9	particular disease state; thereby enabling a diagnostician			
10	to gain the ability to characterize either the presence or			
11	absence of said at least one disease state relative to			
12	recognition of the presence and/or the absence of said			
13	biopolymer, predict disease risk assessment, and develop			
14	therapeutic avenues against said disease.
